

Care/medicine/items	Assets exist	45%	Map items into gameplay/UI, confirm readability, remove stale expectations.
Habitat/environment	All 10 species loadout-proven	70%	Pilot interaction zones/occlusion are in place; remaining work is richer enter/perch/hide/use behavior and final visual polish.
Overlay UI	Direction is clear	50%	Implement Claude/visual design direction in vNext without replacing pet overlay.
PET TASKS/tool hub	Functional seed exists	40%	Simpler UI, artifact buttons, report-only polish, then approval-gated execution.
Screenshot/capture tools	Planned	20%	Wevito-window screenshot first, then region capture, later short proof clips.
Translation/audio tools	Early implementation/plans	30%	Confirm provider UX, DeepL/API handling, safe Windows volume only, external booster handoff.
Coding helpers	Planned/partial	25%	Code review reports, patch plans, then tightly approved patch execution.
Sprite Workflow V2	Designed, not built	20%	One-screen workbench, provenance, contact sheets, dry-run/apply/rollback.
Creative Learning Lab	Concept planned	15%	Reviewed examples, preference memory, dataset/export dashboard, no uncontrolled training.
Pet AI agents	Concept planned	18%	Three named helper pets, roles, task cards, permissions, logs, no unsafe autonomy.
Final release QA	Not ready yet	42%	Full tests, Godot proof, in-game sweeps, final docs/help, packaging.

Remaining Work By Category

Game Core

```
game core
  "simulation"
  "personality development"
  "needs/drives/emotions"
  "affection/relationships"
  "health/body condition"
  "aging/death/ghost state"
  "save/load migrations"
  "interactions"
  "feeding"
  "drinking"
  "medicine/care"
```

```

â”, â”œâ”€ bathing/grooming
â”, â”œâ”€ sleep/rest
â”, â””â”€ ball play/fetch sequence
â”,
â””â”€ proof
  â”œâ”€ forced dev scenarios
  â”œâ”€ UI/control verification
  â””â”€ in-game interaction sweeps

```

Priority: high.

Main reason: this is the actual game spine. Visuals and tools become easier to validate once pet behavior is deterministic and visibly connected to actions.

Visuals And Animation

```

visual lane
â”œâ”€ keep
â”, â”œâ”€ current color folder coverage
â”, â”œâ”€ cleaned shared assets
â”, â”œâ”€ runtime overlay prop contract
â”, â””â”€ visual-side review discipline
â”,
â”œâ”€ finish
â”, â”œâ”€ final in-motion sprite QA
â”, â”œâ”€ optional ball animations
â”, â”œâ”€ snake/frog/bird motion quality
â”, â”œâ”€ size consistency
â”, â”œâ”€ no fake PNG backgrounds
â”, â”œâ”€ no holes/noise/edge residue
â”, â””â”€ final color variant acceptance
â”,
â””â”€ defer until base quality is stable
  â”œâ”€ ghost variants
  â”œâ”€ fat/skinny variants
  â””â”€ broad new generation

```

Priority: high, but coordinated with visual-side.

Main reason: sprite quality is the most visible product risk. The current direction is much safer than the earlier confusing workflow, but final animation proof still matters.

Habitat, Items, And Environment

```

world/content
â”œâ”€ care/medicine mapping
â”œâ”€ food/water/toy mapping
â”œâ”€ egg lifecycle assets
â”œâ”€ habitat object loadouts

```

```

â”€ runtime interaction anchors
â”€ depth bands and occlusion
â”€ contact shadows
â””â”€ stale asset reference cleanup

```

Priority: medium-high.

Main reason: this turns Wevito from "pets on a screen" into pets that live in a readable world.

Overlay UI And Tool Hub

```

overlay/tool hub
â”€ overlay remains home
â”€ summoned tool surfaces
â”€ PET TASKS command bar
â”€ three helper pets
â”€ task cards
â”€ result cards
â”€ artifact buttons
â”€ report-only labels first
â””â”€ approval gates before execution

```

Priority: high for code-side.

Main reason: this is the bridge between the pet sim and the powerful helper-tool fantasy. It must stay simple.

Helper Tools

```

helper tools
â”€ safe/report-only first
â”, â”€ localDocs
â”, â”€ spriteAudit
â”, â”€ assetInventory
â”, â”€ petState
â”, â”€ codeReview
â”, â””â”€ codePatchPlan
â”,
â”€ approval-gated next
â”, â”€ buildProof
â”, â”€ Wevito-window screenshot
â”, â”€ selected-region screenshot
â”, â”€ translation execution
â”, â””â”€ safe Windows volume control
â”,
â””â”€ later / high-risk
    â”€ screen recording
    â”€ browser automation
    â”€ external audio boosters

```

```

â”€â”€â”€ sprite generation/import
â”€â”€â”€ mutation/apply workflows

```

Priority: medium-high.

Main reason: tools make Wevito meaningfully useful beyond a game, but unsafe automation too early would create chaos.

Sprite Workflow V2

```

Sprite Workflow V2
â”€â”€â”€ one selected row visible at a time
â”€â”€â”€ source/runtime/candidate/proof strips
â”€â”€â”€ validator findings
â”€â”€â”€ provenance and hashes
â”€â”€â”€ no-mutation preview mode
â”€â”€â”€ one-row apply plan
â”€â”€â”€ backup-before-apply
â”€â”€â”€ exact rollback
â”€â”€â”€ post-apply proof packet

```

Priority: medium.

Main reason: this should eventually replace the confusing external sprite workflow experience, but it should start read-only and compact.

Creative Learning Lab And AI Agents

```

AI/helper-agent lane
â”€â”€â”€ exactly three active helper pets
â”€â”€â”€ names/roles assigned by user
â”€â”€â”€ task bar accepts natural language
â”€â”€â”€ pet personality affects presentation, not permissions
â”€â”€â”€ reviewed examples become learning data
â”€â”€â”€ preference snapshots
â”€â”€â”€ artifact-backed memory
â”€â”€â”€ local/vector search later
â”€â”€â”€ no uncontrolled self-training

```

Priority: medium-low until tool foundations are stable.

Main reason: this is exciting, but it only becomes trustworthy after artifacts, permissions, and rollback rules are solid.

Recommended Execution Order

```

next best sequence
â”€â”€ 1. finish Tool Hub/PET TASKS UI clarity
â”€â”€ 2. finish action/animation/prop contract
â”€â”€ 3. implement staged fetch/drink/care proof flows
â”€â”€ 4. map care/items/habitats into runtime UI
â”€â”€ 5. let visual-side finish targeted sprite/animation QA
â”€â”€ 6. add safe helper tools one at a time
â”€â”€ 7. build Sprite Workflow V2 read-only workbench
â”€â”€ 8. add controlled apply/proof/rollback gates
â”€â”€ 9. add Creative Learning Lab reviewed-data surface
â”€â”€ 10. run final in-game QA and release packaging

```

Current Source-Of-Truth Docs

Use these documents when updating this dashboard:

- docs/WEVITO_FULL_PROJECT_STATUS_AND_COMPLETION_ROADMAP_2026-05-05.md
- docs/WEVITO_VISUAL_COMPLETION_TRACKER_2026-05-05.md
- docs/WEVITO_VISUAL_STATUS_DASHBOARD_2026-05-05.md
- docs/WEVITO_TOOL_AGENT_UI_MASTER_PLAN_2026-05-05.md
- docs/WEVITO_PET_HELPER_FUNCTIONS_ROADMAP_2026-05-05.md

- docs/CODE_SIDE_DEEP_REVIEW_AND_AGENT_TOOLS_PLAN_2026-05-05.md

Update Workflow

- Edit this markdown file when a phase completes or a percentage changes.
- Regenerate the quick PDF snapshot:

```
powershell -NoProfile -ExecutionPolicy Bypass -File .\tools\export-project-dashboard-pdf.ps1
```

- Regenerate the polished PDF packet:

```
python .\tools\export-project-dashboard-packet-pdf.py
```

- Confirm the PDFs exist at:

```

docs/WEVITO_PROJECT_COMPLETION_DASHBOARD_2026-05-05.pdf
docs/WEVITO_PROJECT_COMPLETION_DASHBOARD_PACKET_2026-05-05.pdf

```

- If the dashboard becomes materially outdated, create a new dated copy instead of overwriting historical context.
